Welcome to Ubuntu 22.04.5 LTS (GNU/Linux 5.15.0-101-generic x86_64)

 * Documentation:  https://help.ubuntu.com
 * Management:    https://landscape.canonical.com
 * Support:       https://ubuntu.com/pro

System information as of Mon Nov  3 19:09:00 UTC 2025

System load: 0.03           Processes:              92
Usage of /: 20.2% of 9.10GB   Users logged in:       0
Memory usage: 32%           IPv4 address for eni6: 217.154.182.175
Swap usage: 0%

Expanded Security Maintenance for Applications is not enabled.

0 updates can be applied immediately.

Enable ESM Apps to receive additional future security updates.
See https://ubuntu.com/esm or run: sudo pro status

New release '24.04.3 LTS' available.
Run 'do-release-upgrade' to upgrade to it.

- Configuración de Virtual Hosts:
- Crea archivos de configuración en /etc/apache2/sites-available/ para cada sitio.
- Usa directivas como ServerName, DocumentRoot
- Activación de sitios: Habilita los sitios con a2ensite y recarga Apache.

```
GNU nano 2.9.3 /etc/apache2/sites-available/joomla.biskmatar.com.conf
<VirtualHost *:80>
    # The ServerName directive sets the request scheme, hostname and port that
    # the server uses to identify itself. This is used when creating
    # redirection URLs. In the context of virtual hosts, the ServerName
    # specifies what hostname must appear in the request's Host: header to
    # match this virtual host. For the default virtual host (this file) this
    # value is not decisive as it is used as a last resort host regardless.
    # However, you must set it for any further virtual host explicitly.
    #ServerName joomla.biskmatar.com

    ServerAdmin webmaster@localhost
    DocumentRoot /var/www/html/joomla.biskmatar.com

    # Available loglevels: trace8, ..., trace1, debug, info, notice, warn,
    # error, crit, alert, emerg. It is essential that you set up the loglevel
    # in the global loglevel to the equivalent page in Debian, from which the Ubuntu
    # module is derived. To see the available loglevels, run the following command as
    # root: $ sudo systemctl reload apache2. To replace this file located at
    # /var/www/html/index.html.
    #LogLevel info trace:warn

    # The following line defines the location of the web site and don't know what this page is about, this probably means
    # that the site is not yet configured. To see the available loglevels, run the following command as root: $ sudo systemctl reload apache2. To replace this file located at
    # /var/www/html/index.html.
    #ErrorLog ${APACHE_LOG_DIR}/error.log
    #CustomLog ${APACHE_LOG_DIR}/access.log combined

    # For most configuration files from conf-available/, which are
    # enabled or disabled at a global level, it is possible to
    # include a line for only one particular virtual host. For example the
    # following line enables the CGI configuration for this host only
    # after it has been globally disabled with "a2disconf".
    #Include conf-available/serve-cgi-bin.conf

</VirtualHost>

# vim: syntax=apache ts=4 sw=4 sts=4 sr noet
```

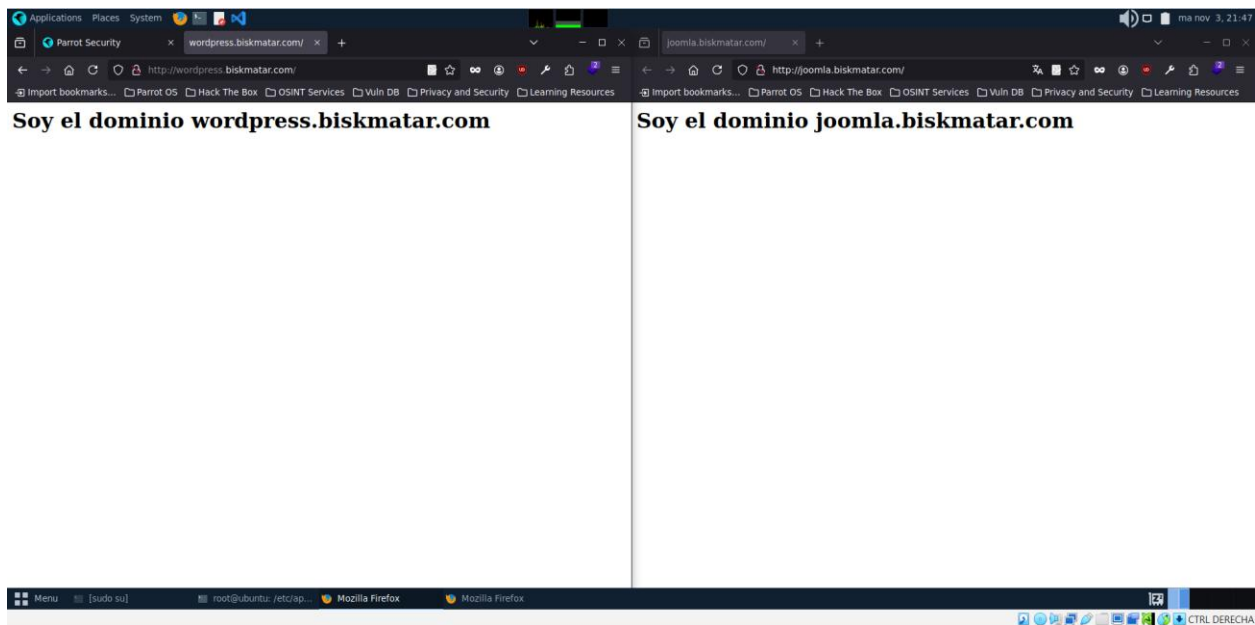

```
ServerName wordpress.biskmatar.com
ServerAdmin webmaster@localhost
DocumentRoot /var/www/html/wordpress.biskmatar.com
```

```
root@ubuntu:/etc/apache2/sites-available# ls
000-default.conf default-ssl.conf
root@ubuntu:/etc/apache2/sites-available# cp 000-default.conf joomla.biskmatar.com.conf
